```
"""
Application builder for AI-Breadboard FastAPI application.

This module provides the main application factory pattern that:
- Initializes FastAPI app with middleware and configuration
- Registers all routers with automatic discovery
- Mounts static files and UI pages
- Configures OpenAPI/Swagger documentation

Usage:
    from src.app import create_app, register_routers

    app = create_app()
    state = AppState()
    app.state.app_state = state
    register_routers(app, state)
    uvicorn.run(app, host="0.0.0.0", port=8000)

Architecture:
    src/app/
    ■■■ __init__.py          # Application factory
    ■■■ state.py             # AppState dataclass
    ■■■ middleware.py        # HTTP middleware
    ■■■ cors.py              # CORS configuration
    ■■■ metrics.py           # Metrics collector
    ■■■ ws_hub.py            # WebSocket hub
    ■■■ routers/             # API routers (auto-discovered)
    ■   ■■■ __init__.py
    ■   ■■■ *.py            # Individual routers
    ■■■ pages/               # UI page handlers
    ■   ■■■ __init__.py
    ■   ■■■ *.py            # Individual page handlers
    ■■■ config_api.py        # AI provider configuration endpoints
    ■■■ versioning.py        # Version check and update logic
    ■■■ tests/               # Application tests

"""
Converter for converting between dict and SimpleNamespace objects.

Functions:
    - `dict2ns`: Recursively convert dictionaries to SimpleNamespace objects.
    - `dict2xml`: Generate an XML string from a dictionary.
    - `dict2csv`: Save dictionary or SimpleNamespace data to a CSV file.
    - `dict2json`: Save dictionary or SimpleNamespace data to a JSON file.
    - `dict2xls`: Save dictionary or SimpleNamespace data to an XLS file.
    - `dict2html`: Generate an HTML table string from a dictionary or SimpleNamespace object.
    - `dict2pdf`: Save dictionary data as a PDF file.

"""
JSON data conversion module.

Functions:
    - `json2csv`: Convert JSON data to CSV format.
    - `json2ns`: Convert JSON data to SimpleNamespace object.
    - `json2xml`: Convert JSON data to XML format.
    - `json2xls`: Convert JSON data to XLS format.
"""

def json2csv(json_data: str | list | dict | Path, csv_file_path: str | Path) -> bool:
    """
    Convert JSON data or JSON file to CSV format with a comma delimiter.

    Args:
        json_data (str | list | dict | Path): JSON data as a string, list of dictionaries, or file path to a JSON file.
        csv_file_path (str | Path): Path to the CSV file to write.

    Returns:
        bool: True if successful, False otherwise.

    Raises:
        ValueError: If unsupported type for json_data.
        Exception: If unable to parse JSON or write CSV.

"""FTP interface for sending, receiving, and deleting files from FTP servers.

Allows for sending media files, spreadsheets, and other files to and from an FTP server.

Dependencies:
- typing: Type hints for function parameters and return values.
- ftplib: Provides FTP protocol client capabilities.
- pathlib: For handling file system paths.

Functions:
    - `write`: Sends a file to an FTP server.
    - `read`: Retrieves a file from an FTP server.
    - `delete`: Deletes a file from an FTP server.
"""

"""SMTP email interface utilities for sending email messages via SMTP server."""

""" This module provides functionality to send and receive emails using an SMTP or IMAP server.
It includes functions to send emails using SMTP and retrieve emails using IMAP.

Functions:
    - `send(subject: str = '', body: str = '', to: str = 'one.last.bit@gmail.com') -> bool`
      Sends an email using the SMTP server specified in the `_connection` dictionary.  Returns `True` on success, `False` on failure.  Includes error logging.

    - `receive(imap_server: str, user: str, password: str, folder: str = 'inbox') -> Optional[List[Dict[str, str]]]`
      Retrieves emails from an IMAP server and returns them as a list of dictionaries.  Returns `None` on error. Includes error logging.

** Important Considerations for Security and Robustness **:

    - **_connection Dictionary:** Do *not* hardcode credentials in this file.  Move the `_connection` dictionary to environment variables (e.g., using `os.environ`). This is cru

    - **Error Handling:** The code includes robust error handling, logging exceptions with details (subject, body, etc.).  This is very helpful for debugging.

    - **Email Parsing:** The `receive` function handles various email formats gracefully, preventing potential issues.

    - **MIME Handling:**  The code correctly uses `MIMEText` for constructing the email message, crucial for sending basic text emails.

```
<#
.SYNOPSIS
    Standalone applications launcher for AI Breadboard (/tc and /apps Test Computer microservices).

.DESCRIPTION
    Launches only the test computer applications block configured in config_tc.json:
    - Dedicated /tc web interface
    - Configured system test microservices (Network, System Inspector, Sysadmin, Control Center, Log Viewer, Software Audit, Registry Viewer, Startup Auditor)

.PARAMETER Action
    Action to perform: 'start' (default), 'stop', 'restart', 'status'.

.PARAMETER NewWindow
    Launch microservices in visible standalone console windows (default: $true).

.PARAMETER Background
    Launch microservices in background processes without opening visible windows.

.PARAMETER ConfigFile
    Custom configuration JSON file name (default: config_tc.json or config.json).

.PARAMETER Port
    Override server bind port (default: from config_tc.json / config.json or 8000).

.PARAMETER HostAddress
    Override server bind address (default: from config_tc.json / config.json or 127.0.0.1).

.PARAMETER NoBrowser
    Do not automatically open the web browser.

.PARAMETER EnableTray
    ■■■■■■■■■ ■■■■■■■■■■■ ■ ■■■■■■■■■■ ■■■■■■ Windows (■■ ■■■■■■■■■■: $true).
    ■■■■■■■: -Tray, -SystemTray, -tray_mode.

.PARAMETER DisableCloseButton
    ■■■■■■■■■■ ■■■■■■■ ■■■■■■■■■ ■■■■■■■■ ([X]) ■■■■ ■■■■■■■■■■■■■■■■ ■■■■■■■■■■■■ ■■■■■■■■■■■■ ■■■■■■■■■.
    ■■■■■■■: -ProtectClose, -NoClose.

.PARAMETER Interactive
    Run in interactive menu selection mode (-i).

.PARAMETER Help
    Display usage help for the launcher (-Help, -h, --help).

.EXAMPLE
    .\tc.ps1
    .\tc.ps1 -Action status
    .\tc.ps1 -Action stop
    .\tc.ps1 -Action restart
    .\tc.ps1 -ConfigFile config_tc.json
    .\tc.ps1 -Background
    .\tc.ps1 -Interactive
    .\tc.ps1 -DisableCloseButton
    .\tc.ps1 --help
#>

<#
.SYNOPSIS
    Standalone launcher for Log Audit & Intelligence application (/tc#tab-system-logs).

.DESCRIPTION
    Launches only the Log Audit & Intelligence application:
    - Runs the web server with direct navigation to /tc#tab-system-logs
    - Supports start, stop, restart, and status checks
    - Opens dedicated web interface or runs in background/foreground

.PARAMETER Action
    Action to perform: 'start' (default), 'stop', 'restart', 'status'.

.PARAMETER NewWindow
    Launch application server in a separate console window.

.PARAMETER Background
    Launch application server in background process without visible console.

.PARAMETER ConfigFile
    Custom configuration JSON file name (default: config_tc.json or config.json).

.PARAMETER Port
    Override server bind port (default: from config or 8000).

.PARAMETER HostAddress
    Override server bind address (default: from config or 127.0.0.1).

.PARAMETER NoBrowser
    Do not automatically open the web browser.

.PARAMETER Interactive
    Run in interactive menu selection mode (-i).

.PARAMETER Help
    Display usage help for the launcher (-Help, -h, --help).

.EXAMPLE
    .\log_audit.ps1
    .\log_audit.ps1 -Action status
    .\log_audit.ps1 -Action stop
    .\log_audit.ps1 -Action restart
    .\log_audit.ps1 -Background
    .\log_audit.ps1 -Interactive
    .\log_audit.ps1 --help
