### 1. Что это такое?
Компонент для мгновенного перехвата операций файловой системы в режиме реального времени на базе WinAPI ReadDirectoryChangesW с поддержкой одновременного наблюдения за произвольным количеством папок.

### 2. Типы отслеживаемых действий:
- Created: Создание нового файла или папки (FILE_ACTION_ADDED).
- Modified: Модификация содержимого, атрибутов или размера файла (FILE_ACTION_MODIFIED).
- Deleted: Удаление файла или папки с диска (FILE_ACTION_REMOVED).
- Renamed: Переименование объекта (старое и новое имя).

### 3. Как выбрать или добавить папки?
1. Нажмите кнопку «Папка» в заголовке панели.
2. Откроется модальное окно с проводником файловой системы.
3. Выберите логический диск (C:, D:, E:), перейдите в нужную папку или вставьте путь вручную.
```

```
4. Нажмите «+ Добавить папку» или кнопку «Следить» напротив любой подпапки.
5. Нажмите «Применить и запустить». Список сохранится в config.json и мониторинг стартует автоматически!`,

// ============================================================
==================
// Process Name: About System Tab Web Controller
// ============================================================
==================
// Description:
//   Client-side JavaScript controller for the About System ta
b.
//   Provides real-time host telemetry, system identity & loca
le parameters,
//   AIDA64-like hardware tree, WMI sensors, live top processe
s,
//   disk volumes and security status.
//
//   Data source: telemetry.db only (via /api/windows/dashboar
d/*)
//   Removed LibreHardwareMonitor (LHM) dependency
//
//   КЕШИРОВАНИЕ (IndexedDB + Memory):
//   - Stale-While-Revalidate для всех данных
//   - Cache-First для hardware spec (меняется редко)
//   - Network-First для live telemetry (всегда свежие)
//   - Prefetching при активации вкладки
//
// File: main.js
// Package: src.api.webgui.about_system_tab

# -*- coding: utf-8 -*-
"""
Заполняет файлы локалей (en.json, he.json) переводами из CSV.

CSV-файл должен содержать заголовки:
    key,en,he
где `key` – идентификатор строки, `en` и `he` – переводы.

Если CSV не содержит перевод для языка, оставляется пустая стр
ока.

Для генерации шаблона `locales/template.json` (ключи с пустыми
 значениями) используйте опцию `--generate-template`.

Скрипт безопасно обновляет только указанные языки, не затрагив
ая существующие переводы.

#!/usr/bin/env python3
"""Utility to auto-extract hardcoded Russian strings from the web GUI
and inject them into locale JSON files (ru.json, en.json, he.json).
It also rewrites HTML files, wrapping the literals with a <span data-i18n="...">
so that the UI becomes fully internationalised.

The script follows these steps:
1. Load existing locale files from `src/api/webgui/locales/`.
2. Scan all `.html` and `.js` files under `src/api/webgui/` for Cyrillic text.
3. For each found literal that is not already referenced via `data-i18n` or
   `i18n.t(...)`, generate a deterministic key based on a slug of the text.
4. Insert the key/value pair into `ru.json` (value = original Russian text).
   Insert empty placeholder strings into `en.json` and `he.json` if the key is new.
5. Rewrite the source file, replacing the literal with a `<span data-i18n="key"></span>`
   in HTML, or with `i18n.t('key')` in JavaScript (simple string context).

The script is safe to run repeatedly – it will not duplicate keys.
